01 PROFILE

I like the point where a circuit stops being a diagram and starts doing something.

Twenty years old, studying mechatronics engineering in Egypt. Mechatronics sits between mechanical, electronics and code, which is why I learned a bit of each rather than picking one. Most of what I know came from building things and breaking them: microcontroller projects, sensors, motors, and the software that ties them together. I also work on mobile apps, usually because an app is the easiest way to control something you have built. I am comfortable reading a datasheet, debugging a circuit that refuses to behave, and explaining any of it in Arabic or English. I help other students often; teaching is the fastest way to find out what you understand.

02 FOCUS

I	Embedded electronics	Microcontrollers, sensors, motor drivers, and the wiring between them.
II	Control & motion	Reading a sensor, deciding, and moving accordingly. Feedback loops and tuning.
III	Mobile & software	Apps and small tools, built to control or monitor the hardware I am working on.
IV	Putting it together	Getting the board, the code and the interface to agree. The part that teaches most.
V	Explaining things	Helping other students get unstuck, in Arabic or English.

03 STACK

CODE	BOARDS & PARTS	BENCH
C / C++ Python Dart MATLAB	Arduino ESP32 Raspberry Pi Sensors Motor drivers	Soldering Multimeter Circuit debugging Breadboarding
SOFTWARE	DESIGN TOOLS	LANGUAGES
Flutter Git Firebase Linux basics	SolidWorks Fusion 360 Proteus	Arabic — native English — fluent

Some of these I use every week; others I have used enough to be useful and not enough to call myself an expert. Ask me which is which and I will tell you.
